The verticies of S^3 embedded in R^4 are given by (0,0,0,0), (0,0,0,1), (0,0,1,1), (0,1,1,1). The edge spheres have the equations

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_4 = 0$$

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_3 - x_4 = 0$$

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_2 - x_3 - x_4 = 0$$

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_3 - 2x_4 + 1 = 0$$

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_2 - x_3 - 2x_4 + 1 = 0$$

$$(x_1)^2 + (x_2)^2 + (x_3)^2 + (x_4)^2 - x_2 - 2x_3 - 2x_4 + 2 = 0.$$

The first two equations imply $x_3 = 0$, and the last two imply $x_3 = 1$, a contradic-

Semilinear Equations in R" Without Condition at Infinity

Université Paris VI, 4, place Jussieu, 75230 Paris Cedex 05, France

Communicated by D. Kinderlehrer

behavior at infinity. A typical example is the following: Let $1 . For every <math>f \in L^1_{loc}(\mathbb{R}^N)$ there is a unique $u \in L^p_{loc}(\mathbb{R}^N)$ satisfying Abstract. In this paper we establish that some nonlinear elliptic (and parabolic) problems are well posed in all of R^N without prescribing the

$$-\Delta u + [u]^{p-1}u = f(x) \quad \text{on } \mathbb{R}^N$$

Introduction

The purpose of this paper is to point out that some nonlinear elliptic (and parabolic) problems are well-posed in all of \mathbb{R}^N without conditions at infinity. A typical example is the following:

Theorem 1. Let $1 . For every <math>f \in L^1_{loc}(\mathbb{R}^N)$ there exists a unique $u \in L^p_{loc}(\mathbb{R}^N)$ satisfying

$$-\Delta u + |u|^{p-1}u = f(x) \quad \text{in } \mathscr{D}'(\mathbb{R}^N).$$

 Ξ

Moreover, if $f \ge 0$ a.c. then $u \ge 0$ a.e.

Remark 1. It was previously known that for every $f \in L^1(\mathbb{R}^N)$ there exists a unique $u \in L^p(\mathbb{R}^N)$ satisfying (1) (see [3], Theorem 5.11). However, we emphasize the solution u is unique without prescribing its behavior at infinity. that in Theorem 1 there is no limitation on the growth at infinity of the data f and

Semilinear Equations

273

Proof of Theorem 1

Santence

Let $B_R = \{x \in \mathbb{R}^N; |x| < R\}$. We start with some local estimate:

Lemma 1. Let R < R' and assume $u \in L^r_{loc}(B_R)$ satisfies

$$-\Delta u + |u|^{\rho-1}u = f(x) \quad \text{in } \mathcal{D}'(B_{R'}) \tag{2}$$

with $f \in L^1(B_{R'})$. Then

$$\int_{B_R} |u|^p \leqslant C \left(1 + \int_{B_{R'}} |f| \right) \tag{3}$$

where C depends only on p, R and R'.

Remark 2. The conclusion of Lemma 1 is a rather unusual localization property. Indeed, let Ω and Ω' be bounded open sets in \mathbb{R}^N such that $\Omega \cap \Omega' = \emptyset$ and let u be the solution of (1). On the one hand the values of f in Ω' "affect" the solution u in Ω : for example, if f > 0 in Ω' and $f \equiv 0$ outside Ω' it follows from the strong maximum principle that u > 0 in Ω . On the other hand the values of f in Ω' affect only "mildly" u in Ω : in view of (3) $u|_{\Omega}$ may be estimated independently of $f|_{\Omega'}$, even if $f \to \infty$ on Ω' , $\int_{\Omega} |u|^p$ still remains bounded.

Proof of Lemma 1. We use a device introduced by P. Baras and M. Pierre [2]. By Kato's inequality (see [10]) and (2) we have

$$-\Delta |u| + |u|^p \leqslant |f| \quad \text{in } \mathcal{D}'(B_{R'}). \tag{4}$$

Let $\zeta \in \mathcal{D}(B_{R'})$ be such that $0 \le \zeta \le 1$ and $\zeta = 1$ on $B_{R'}$. Multiplying (4) through by ζ^{α} where α is an integer, and integrating we find

$$\int |u|^p \xi^\alpha \leqslant \int |f| + C \int |u| \xi^{\alpha - 2} \leqslant \int |f| + C \int |u| \xi^{\alpha / p},\tag{5}$$

provided $\alpha - 2 \ge \alpha/p$, i.e., $\alpha \ge 2p/(p-1)$ and we fix any such α . The conclusion of Lemma 1 follows easily from (5).

Proof of Theorem 1. Existence

LC(

$$f_n(x) = \begin{cases} f(x) & \text{if } |x| < n \\ 0 & \text{if } |x| \ge n. \end{cases}$$

Let $u_n \in L^p(\mathbb{R}^N)$ be the unique solution of

$$-\Delta u_n + |u_n|^{p-1}u_n = f_n \quad \text{in } \mathscr{D}'(\mathbb{R}^N)$$

6

(see [3], Theorem 5.11).

We deduce from Lemma 1 that there is a constant C such that

$$||u_n||_{L^p(B_R)} \leqslant C$$

where C depends only on ρ , R and f, and thus we also have

$$||\Delta u_n||_{L^1(B_R)} \leq C.$$

It follows that (for some subsequence still denoted by u_n) we have

$$u_n \to u \text{ in } L^1_{loc}(\mathbb{R}^N)$$

 $u_n \to u \text{ a.c. on } \mathbb{R}^N.$

We claim that

$$|u_n|^{p-1}u_n\to |u|^{p-1}u\quad\text{in }L^1_{\text{loc}}(\mathbb{R}^N).$$

It suffices to verify that $|u_n|^{p-1}u_n$ is a Cauchy sequence in $L^1(B_R)$ for any R. By Kato's inequality and (6) we have

$$-\Delta |u_n - u_{n!}| + ||u_n|^{p-1} u_n - |u_{n!}|^{p-1} u_n| \le |f_n - f_{n!}|.$$

Let $\zeta \in \mathcal{D}(\mathbb{R}^N)$ be such that $0 \le \zeta \le 1$ and $\zeta = 1$ on B_R . We have

$$\int |\{u_n\}^{p-1}u_n - \{u_m\}^{p-1}u_m|\} \le \int |f_n - f_m|\} + \int |u_n - u_m| \Delta \}$$

and the RHS tend to zero as $m, n \to \infty$. Passing to the limit in (6) we obtain (1).

Uniqueness

We shall need the following:

Lemma 2. Assume $u \in L^p_{loc}(\mathbb{R}^N)$ satisfies

$$-\Delta u + |u|^{p-1}u \leq 0 \text{ in } \mathscr{D}'(\mathbb{R}^N).$$

3

Then $u \leq 0$ a.e. on \mathbb{R}^N ,

Remark 3. Lemma 2 is closely related to the results of J. Keller [11] and R. Osserman [13] (see also the earlier works quoted in these papers).

*Proof. We use a comparison function of the same type as in Osserman [13] (see also C. Loewner and L. Nirenberg [12]). Set

$$U(x) = \frac{CR^{\alpha}}{\left(R^2 - |x|^2\right)^{\alpha}} \quad \text{in } B_R$$

where R > 0, $\alpha = 2/(p-1)$ and $C^{p-1} = 2\alpha \max\{N, \alpha+1\}$. A direct computation shows that

$$-\Delta U + U^p \geqslant 0 \quad \text{in } B_R \tag{8}$$

and thus

$$-\Delta(u-U)+|u|^{p-1}u-U^p\leqslant 0\quad\text{in }\mathcal{D}'(B_R).\tag{9}$$

Using a variant of Kato's inequality (see Lemma A.1 in the Appendix) we deduce from (9) that

$$-\Delta(u-U)^{\dagger} + (|u|^{p-1}u - U^p)\operatorname{sign}^{\dagger}(u-U) \le 0 \text{ in } \mathcal{D}'(B_R)$$
(10)

and therefore

$$-\Delta(u-U)^{\dagger} \leqslant 0 \quad \text{in } \mathscr{D}'(B_R). \tag{11}$$

From Lemma A.1 and (7) we deduce that

$$-\Delta u^+ + (u^+)^P \le 0 \text{ in } \mathcal{D}'(\mathbb{R}^N)$$

and therefore

$$-\Delta u^+ \leq 0$$
 in $\mathscr{D}'(\mathbb{R}^N)$,

i.e., u^+ is subharmonic and in particular $u^+ \in L^{\infty}_{loc}(\mathbb{R}^N)$. It follows that for some $\delta > 0$ we have

$$(u-U)^{+} = 0 \quad \text{for } R - \delta < |x| < R \tag{12}$$

(since $U(x) \to +\infty$ as $|x| \to R$, $x \in B_R$). Combining (11) and (12) we obtain that $(u-U)^+=0$ a.e. on B_R , i.e., $u \leqslant U$ a.e. on B_R .

Keeping x fixed and letting $R \to \infty$ we see that $u \le 0$ a.e. on \mathbb{R}^N

Proof of Theorem 1. Uniqueness.

Let u_1 and u_2 be two solutions of (1) and let $u = u_1 - u_2$. By Kato's inequality we have

$$-\Delta |u| + \left| |u_1|^{p-1} u_1 - |u_2|^{p-1} u_2 \right| \le 0 \text{ in } \mathcal{D}'(\mathbb{R}^N). \tag{13}$$

On the other hand, there is a constant $\delta > 0$ —depending only on p— such that

$$||a|^{p-1}a - |b|^{p-1}b| \ge \delta|a - b|^p \quad \forall a, b \in \mathbb{R}. \tag{14}$$

From (13) and (14) we deduce that

$$-\Delta|u|+\delta|u|^p\leqslant 0 \text{ in } \mathscr{D}'(\mathbb{R}^N).$$

Using Lemma 2 we conclude that u = 0.

3. Miscellaneous Remarks and Generalizations

A. Monotone Nonlinearities

The proof of Theorem 1 extends easily to the case where $|u|^{p-1}u$ is replaced by a more general function g(u). Assume $g: \mathbb{R} \to \mathbb{R}$ is a C^1 function such that

$$g'(u) \geqslant a|u|^{p-1} \quad \forall u \in \mathbb{R},$$

for some constants a > 0 and $1 (for example, <math>g(u) = \sinh u$, etc...).

Theorem 1'. For every $f \in L^1_{loc}(\mathbb{R}^N)$ there exists a unique $u \in L^p_{loc}(\mathbb{R}^N)$ with $g(u) \in L^1_{loc}(\mathbb{R}^N)$ satisfying

$$-\Delta u + g(u) = f(x) \quad \text{in } \mathscr{D}'(\mathbb{R}^N). \tag{16}$$

B. Nonmonotone g's

Let $g(x, u): \mathbb{R}^N \times \mathbb{R}$ be measurable in x and continuous in u. We assume that:

$$g(x,u)$$
 sign $u \ge a|u|^p - \omega(x)$ for a.e. $x \in \mathbb{R}^N$, for all $u \in \mathbb{R}$ (17)

where $\omega \in L^1_{loc}(\mathbb{R}^N)$ and a > 0, 1 and also

$$h_{\mathcal{M}}(x) = \sup_{|u| \le M} |g(x, u)| \in L^1_{loc}(\mathbb{R}^N) \quad \text{for all } M > 0.$$
 (18)

Theorem 2. There exists $u \in L^p_{loc}(\mathbb{R}^N)$ such that $g(\cdot, u) \in L^1_{loc}(\mathbb{R}^N)$ satisfying

$$\Delta u + g(x, u) = 0 \text{ in } \mathcal{D}'(\mathbb{R}^N). \tag{19}$$

Sketch of the Proof. First we consider the case of a smooth bounded domain $\Omega \subset \mathbb{R}^N$.

Claim. There exists $u \in W_0^{1,1}(\Omega)$ such that $g(\cdot, u) \in L^1(\Omega)$, satisfying

$$-\Delta u + g(x, u) = 0 \quad \text{on } \Omega.$$

This type of result is closely related—but not quite contained in [6]. Here it suffices to assume (17) with u = 0. For $r \in \mathbb{R}$ and $n \in \mathbb{N}$ we set

$$\tau_n r = \begin{cases} r & \text{if } |r| \le n \\ n & \text{if } r \ge n. \\ -n & \text{if } r \le -n. \end{cases}$$

By the Schauder fixed point theorem there exists $u_n \in W_0^{1,1}(\Omega)$ satisfying

$$-\Delta u_n + g(x, \tau_n u_n) = 0 \quad \text{on} \quad \Omega.$$

Using the fact that $-\int_{\Omega} \Delta u_n \operatorname{sign} u_n \ge 0$ we find

$$\int_{\Omega} |g(x, \tau_n u_n)| \leqslant 2 \int_{\Omega} |\omega|.$$
 herefore

Therefore

$$\int_{\Omega} |\Delta u_{,i}| \le 2 \int_{\Omega} |\omega|. \tag{22}$$

After extracting a subsequence we may assume that

$$u_n \to u \quad \text{in } W_0^{1,1}(\Omega)$$

$$g(x, \tau_n u_n) \rightarrow g(x, u)$$
 a.e.

To show that $g(x, \tau_n u_n) \to g(x, u)$ in $L^1(\Omega)$ we use a new device introduced in [8] by Th. Gallouet and J. M. Morel (with an observation of L. Boecardo). Set

$$p_M(r) = \begin{cases} 1 & \text{if } r > M \\ 0 & \text{if } -M \le r \le M \\ -1 & \text{if } r < -M \end{cases}$$

where $r \in \mathbb{R}$ and M > 0. It is well known that

$$-\int_{\Omega}\Delta u\cdot p_{N}(u)\geqslant 0 \quad \forall u\in W_{0}^{1,1}(\Omega), \, \Delta u\in L^{1}(\Omega).$$

Therefore we have

Semilinear Equations

$$\int_{\Omega} g(x, \tau_n u_n) p_{\mathcal{M}}(u_n) \leq 0,$$

That is,

$$\int_{|u_n| > M} g(x, \tau_n u_n) \operatorname{sign}(u_n) \leq 0$$

and hence

$$\int_{|u_n|>M} |g(x,\tau_n u_n)| \leq 2 \int_{|u_n|>M} |\omega|.$$

(23)

From (22) we see that $||u_n||_{L^1} \le C$ and thus M meas $\{|u_n| > M\} \le C$.

Given $\varepsilon > 0$ we may f(x, M) large enough so that $2 \int_{|u_{\pi}| > M} |\omega| < \varepsilon$. Next, for any measurable $A \subset \Omega$, we have

$$\left| \int_{A} |g(x, \tau_{n} u_{n})| \le \int_{A} |g(x, \tau_{n} u_{n})| + \int_{|u_{n}| > M} |g(x, \tau_{n} u_{n})|$$

$$\le \int_{A} h_{M}(x) + \varepsilon \le 2\varepsilon$$

provided meas $A<\delta$ and δ is small enough. In other words, we have established that

$$\forall \varepsilon > 0$$
 $\exists \delta > 0$ s.t. $\int_A |g(x, \tau_n u_n)| < 2\varepsilon$ when meas $A < \delta$.

We conclude that $g(x, \tau_n u_n) \to g(x, u)$ in $L^1(\Omega)$. We turn now to problem (19). For each n let

$$\Omega_n = \left\{ x \in \mathbb{R}^N; \, |x| < n \right\}.$$

By the previous step there exists $u_n \in W_0^{1,1}(\Omega_n)$ such that $g(\cdot,u_n) \in L^1(\Omega_n)$ satisfying

$$-\Delta u_n + g(x, u_n) = 0 \quad \text{on } \Omega_n. \tag{24}$$

From Kato's inequality and (24) we obtain

$$-\Delta|u_n|+g(x,u_n)\operatorname{sign} u_n\leq 0\quad\text{in }\mathscr{D}'(\Omega_n).$$

Semilinear Equations

And therefore we also have

$$-\Delta|u_n| + a|u_n|^p \leqslant \omega \quad \text{in } \mathscr{D}'(\Omega_n)$$
 (25)

$$-\Delta|u_n| + |g(x, u_n)| \le 2|\omega| \quad \text{in } \mathcal{B}'(\Omega_n). \tag{26}$$

Using the same device as in the proof of Theorem 1 we deduce from (25) that

 u_n is bounded in $L^p_{loc}(\mathbb{R}^N)$.

It follows from (26) that

 $g(\cdot, u_n)$ is bounded in $L^1_{loc}(\mathbb{R}^N)$

 Δu_n is bounded in $L^1_{loc}(\mathbb{R}^N)$.

Hence we may assume that

$$u_n \to u \text{ in } L^1_{loc}(\mathbb{R}^N)$$

 $u_n \to u \text{ a.e. on } \mathbb{R}^N$

 $g(x, u_n) \to g(x, u)$ a.e. on \mathbb{R}^N

Finally we prove that $k(x, u_n) \to g(x, u)$ in $L^1_{loc}(\mathbb{R}^N)$. By a variant of Kato's inequality (see Lemma A.2) we have

$$-\Delta P_M(u) + g(x, u_n) p_M(u_n) \le 0 \text{ in } \mathcal{D}'(\Omega_n)$$

$$P_M(t) = \int_0^t p_M(s) \, ds.$$

Therefore we have

$$\int_{|u_n|>M} |g(x,u_n)| \xi \leqslant 2 \int_{|u_n|>M} |\omega| \xi + \int_{|u_n|>M} |u_n| \Delta \xi \quad \forall \xi \in \mathcal{D}, (\Omega_n).$$

It follows easily that $g(x, u_n)$ is equi-integrable on bounded sets of \mathbb{R}^N and thus $g(x, u_N) \to g(x, u)$ in $L^1_{loc}(\mathbb{R}^N)$.

Measures or More General Distributions as Right Hand Side Data

 $\phi \in L_{loc}(\mathbb{R}^N)$. Then the problem T be a distribution of the form $T = f + \Delta \phi$ where $f \in L^1_{loc}(\mathbb{R}^N)$ and

$$-\Delta u + |u|^{p-1}u = T \quad \text{in } \mathscr{D}'(\mathbb{R}^N)$$
 (27)

has a unique solution $u \in L^{r}_{loc}(\mathbb{R}^{N})$.

result of Section B to v (see also [8] for similar questions on bounded domains). Suppose now that T is a *measure* on \mathbb{R}^N (not necessarily a bounded Indeed it suffices to consider the new unknown $v = u + \phi$ and to apply the

measure). Suppose 1 (no restriction when <math>N = 1, 2). Then there exists a unique solution $u \in L_{loc}(\mathbb{R}^N)$ for (27). Related questions for bounded measures are considered in [5] and [8].

D. Nonlinearities with Growth Close to Linear

Suppose $g: \mathbb{R} \to \mathbb{R}$ is continuous and g(u) behaves like $u | \log u |^{\lambda}$ as $|u| \to \infty$ with k > 2. Then for every $f \in L^1_{loc}(\mathbb{R}^N)$ there exists $u \in L^1_{loc}(\mathbb{R}^N)$ with $g(u) \in L^1_{loc}(\mathbb{R}^N)$ $L^{1}_{loc}(\mathbb{R}^{N})$ satisfying

$$-\Delta u + g(u) = f \text{ in } \mathfrak{D}'(\mathbb{R}^N).$$

As before, we use Kato's inequality to find

$$-\Delta|u|+g(u)\mathrm{sign}\,u\leqslant|f|.$$

 $f \in L^1_{loc}(\mathbb{R}^N)$, there exists a unique function $u \in L^1_{loc}(\mathbb{R}^N)$ with $g(u) \in L^1_{loc}(\mathbb{R}^N)$ satisfying $-\Delta u + g(u) = f$ in $\mathscr{D}'(\mathbb{R}^N)$. convex, and proved the following result. Suppose $g: \mathbb{R} \to \mathbb{R}$ is continuous, nondecreasing, odd. We multiply (28) through by $\eta = e^{-1/y^{\alpha}}$ where $\beta > 2/(k-2)$. Then we estimate $\lceil |u| \mid \Delta \eta \rceil$ with the help of Young's inequality. Recently Gallouet and Morel have $[G(x)]^{-1/2}dx < \infty$ where G is a primitive of g. Then for every

E. Unbounded Domains

Using the same principles as in the proof of Theorem 1 one can show that for every $f \in L^1_{loc}(\overline{\Omega})$ and $\phi \in L^1_{loc}(\partial\Omega)$ there exists a unique $u \in L^1_{loc}(\overline{\Omega})$ satisfying Let $\Omega \subset \mathbb{R}^N$ be any domain (bounded or unbounded) with smooth boundary.

$$-\Delta u + |u|^{p-1}u = f \quad \text{in } \Omega$$

$$u = \phi \qquad \text{on } \partial \Omega.$$

where 1 and the boundary condition is understood in some appropriate

F. Local Regularity

Let $\Omega \subseteq \mathbb{R}^N$ be any domain. Let $g: \mathbb{R} \to \mathbb{R}$ be a continuous and nondecreasing

Theorem 3. Suppose $u \in L^1_{loc}(\Omega)$ is such that $g(u) \in L^1_{loc}(\Omega)$ and satisfies

$$-\Delta u + g(u) = f(x) \text{ in } \mathcal{Q}'(\Omega)$$
where $f \in L^q_{loc}(\Omega)$ and $1 < q < \infty$.
Then $u \in W^{2,q}_{loc}(\Omega)$.

Proof. We may assume that z(0) = 0. We have $-\Delta |u| + g(u) \operatorname{sign} u < \mathcal{F} \quad \text{in } \mathcal{G}(\Omega)$

Semilinear Equations

and thus

$$-\Delta|u|\leqslant |f|$$
 in $\mathscr{D}'(\Omega)$.

It follows that $u \in L^q_{loc}(\Omega)$. Set

$$g_n(r) = g(\tau_n r)$$
 and $P_n(r) = \operatorname{sign} r \int_0^r |g_n(s)|^{q-1} ds$

so that

$$|P_n(r)| \le |r| |g_n(r)|^{q-1} \quad \forall r \in \mathbb{R}.$$

By Lemma A.2 and (29) we have

$$\Delta P_n(u) \ge |g_n(u)|^{q-1} \operatorname{sign} u[g(u) - f] \ge |g_n(u)|^q - |f| |g_n(u)|^{q-1}. \tag{30}$$

Let $\zeta \in \mathcal{D}(\Omega)$ with $0 \leq \zeta \leq 1$; from (30) we see that

$$\begin{split} \int |g_n(u)|^q \zeta^\alpha & \leq C \int |P_n(u)| \zeta^{\alpha-2} + \int |f| \, |g_n(u)|^{q-1} \zeta^\alpha \\ & \leq C \int |u| \, |g_n(u)|^{q-1} \zeta^{\alpha-2} + \int |f| \, |g_n(u)|^{q-1} \zeta^\alpha \end{split}$$

where C is independent of u. Fix any integer $\alpha \ge 2q$; by Hölder's inequality we have

$$\int |g_n(u)|^q \zeta^{\alpha} \leqslant C \int_{\text{supp } \zeta} (|u|^q + |f|^q).$$

As $n \to \infty$ we see that $g(u) \in L^1_{loc}(\Omega)$.

Parabolic Equations

Consider the problem

$$(u_r - \Delta u + |u|^{p-1}u = 0 \quad \text{on } \mathbb{R}^N \times (0, +\infty) \text{ with } 1
$$(u(x,0) = u_0(x) \quad \text{on } \mathbb{R}^N.$$

$$(31)$$$$

Using the same principles as in the proof of Theorem 1 one can show that for every $u_0 \in L^1_{loc}(\mathbb{R}^N)$ there is a unique function $u \in C^2(\mathbb{R}^N \times (0, +\infty)) \cap C([0, +\infty); L^1_{loc}(\mathbb{R}^N))$ satisfying (31).

Results of the same nature for the problem

$$\begin{cases} u_i - \Delta(|u|^{m-1}u) = 0 & \text{on } \mathbb{R}^N \times (0, \infty) \\ u(x, 0) = u_0(x) & \text{on } \mathbb{R}^N \end{cases}$$

situation is totally different; see [1, 4, 7]. have been obtained by M. Herrero-M. Pierre [9] when 0 < m < 1. When m > 1 the

Appendix: Some Variants of Kato's Inequality

Let $\Omega \subset \mathbb{R}^N$ be any open set.

Lemma A.1. Let $u \in L^1_{loc}(\Omega)$ and $f \in L^1_{loc}(\Omega)$ be such that

$$\Delta u \geqslant \int \ln \mathscr{D}'(\Omega)$$
.

$$\Delta u^+ \geqslant \int \operatorname{sign}^+ u \quad \text{in } \mathscr{D}'(\Omega).$$

Lemma A.2. Let $p: \mathbb{R} \to \mathbb{R}$ be a monotone, nondecreasing function such that p is continuous except at a finite number of jumps and $p(\mathbb{R})$ is bounded.

Let
$$P(r) = \int_0^r p(s) ds$$
 and let $u \in L^1_{loc}(\Omega)$ with $\Delta u \in L^1_{loc}(\Omega)$.

$$\Delta P(u) \geqslant (\Delta u)p(u)$$
 in $\mathscr{D}'(\Omega)$

shall omit them. The proofs are easy modifications of Kato's original argument in [10], and we

This paper was written during a visit at the University of Minnesola. I thank the Mathematics Department and the Institute for Mathematics and its Applications for their invitation and hospitality. I thank D. Aronson, C. Kenig, and H. Weinberger for valuable conversations.
